SUSPENDED CEILINGS VS. OPEN PLENUM - LIFE CYCLE STUDY

Ceilings & Interior Systems Construction Association

December 10, 2007

SUSPENDED CEILINGS VS. OPEN PLENUM - LIFE CYCLE STUDY

1. Introduction

The design of commercial ceiling systems is influenced by a number of factors, with a particular focus on the need to accommodate air distribution ducts and plenums, power and telecom wiring, fire & life safety systems, security systems and an increasingly complex and dense distribution of horizontal systems. As buildings and businesses undergo more unpredictable and rapid change, systems are constantly being moved, upgraded and modified requiring greater ease of reconfiguration and flexibility than ever before. The rate of change in office environments, or 'churn rate' is a function of changing technology, personal mobility, and the reconfiguration of workstations. The International Facilities Managers Association (IFMA) defines churn as the number of moves in a year expressed as a percentage of the number of offices occupied. "In the 2002 IFMA Project Management Benchmarks report, the main churn rate across the surveyed organizations was 41 percent.¹

These requirements for flexibility may dictate either a suspended ceiling or an open plenum. A suspended ceiling system may provide a finished interior that allows access to systems located in the plenum space above, and an open plenum may provides a ceiling that leaves systems exposed for ease of accessibility.

The life cycle cost study, initiated by the Ceilings and Interior Systems Construction Association (CISCA), looks at the cost and performance benefits of suspended ceiling vs. open plenum designs for two building types - offices and retail food stores. The study evaluates differences in construction and operating costs, as well as performance issues such as fire integrity, energy performance, ease of maintenance, lighting and acoustic performance, and other design considerations.

2. Life Cycle Costs

The life cycle cost analysis of the office and food store examples includes initial construction costs of suspended ceiling vs. open plenum designs, as well as annual operating costs. Operating costs of HVAC and lighting systems (i.e. re-lamping, utilities, energy costs), maintenance costs such as periodic maintenance, repair and cleaning, and the cost of reconfiguration (moves-adds-changes). Construction costs are based on data from RS Means² and operating costs are based on data from Building Owners and Managers Association International (BOMA)³.

Construction and operating costs are also evaluated for different regions to show a range of different material costs, labor markets, climate regions, and energy costs. The different regions included in the study are Chicago (climate zone 5), Charlotte and Oklahoma City (climate zone 7), Orlando and Phoenix (climate zone 9).

Energy costs for the suspended ceiling and open plenum designs are analyzed for each of these different regions based on computer calculations and comparisons of building loads, energy, and cost.⁴

3. Prototype Office and Food Store

The study is based on an evaluation of typical offices and food stores as examples of two very different building and construction types. The 'prototype' buildings are based on average data from a number of sources, including information from the U.S. Department of Commerce, the U.S. Department of Energy (DOE), the Environmental Protection Agency (EPA), and Building Owners & Managers Association (BOMA). Construction characteristics such as equipment and lighting loads (watts/sq.ft.), and envelope thermal performance are based on minimum code criteria described in ASHRAE Standard 90.1 2004 "Energy Efficient Design of New Buildings Except New Low-Rise Residential Buildings".

3.1 Prototype Office

The prototype office building/space is assumed to be low-rise/mid-rise type I, non-combustible construction of structural steel with a metal deck and concrete floor/ceiling system. According to the 2006 Building Energy Data Book, the typical mid-rise office is 6 to 7 stories, and 90,000 to 137,000 sq.ft. (approx. 12,800 to 22,800 sq.ft./floor), with 40-50% glass. The prototype office building/space is assumed to be a 15,000 sq.ft. typical floor of a multistory building with a nine (9) foot floor to ceiling height and an open plan layout.

Suspended Ceiling System

The suspended ceiling example is assumed to be a standard 2x2x3/4" ceiling tile with a narrow profile suspension system (9/16") and a non- fire rated assembly (figure 1). The open plenum example is assumed to have the underside of the floor slab above to be painted.

HVAC

For the suspended ceiling and open plenum designs, the office systems such as HVAC, power and telecommunications are assumed to be provided from the ceiling. In the suspended ceiling examples, the HVAC air distribution is ducted air supply and plenum air return. In the open plenum ceiling examples, the HVAC air distribution is ducted supply and return. Typical HVAC systems include central heating from a gas boiler and cooling from an electric centrifugal chiller, with constant volume or variable air volume (VAV) air distribution. The typical office annual energy use is about 90,000 Btu/sf/yr and average operating costs are about \$6.00/sq.ft., of which \$1.80/sq.ft. is for utilities.

Electrical and Telecommunications

For the suspended ceiling example electrical wiring is MC cable and telecommunications wiring is plenum cable distributed above the ceiling, without cabletrays. In the open plenum example, power wiring is in conduit and telecommunications cable is plenum cable distributed in cabletrays. For both examples, telecommunications cable is assumed to be plenum rated to meet the requirements of NFPA 90A "Standard for the Installation of Air Conditioning and Ventilating Systems 2002"

Lighting

For the suspended ceiling example light fixtures are assumed to be 2x2 u-tube fluorescent, recess mounted fixtures with acrylic lenses. Return air troffers are assumed for half of the light fixtures.

3.2 Prototype Food Store

The prototype food store building/space is assumed to be type II construction of a one-two story masonry structure with bar joists and a metal deck and concrete floor/ceiling system. Although the typical food store is a small supermarket of about 5,000 sq.ft., there has been a trend since the 1960's for larger supermarkets that dominate much of retail food sales in the United States. "By 1998 the median average store size was 40,483 sq.ft, up from 38,600 sq.ft. in 1966." "A typical new store in 1998 was just over 57,000 sq.ft, up from about 52,400 sq.ft. in 1997. The prototype food store is assumed to be larger than the average, but smaller than the typical large supermarket, with a 10,000 sq.ft. area (100 ft x 100ft).

Suspended Ceiling System

The prototype food store has an eighteen foot (18 ft) floor to ceiling height. The suspended ceiling example includes a standard 2x4x1/2" ceiling tile and an exposed grid suspension system (15/16") in a non-fire rated assembly (figure 2). The open plenum example is assumed to have the underside of the floor/roof slab above to be painted.

HVAC

For the suspended ceiling and open plenum designs, HVAC, power and telecommunications are assumed to be provided from the ceiling. In the suspended ceiling examples, the HVAC air distribution is ducted air supply and plenum air return. The supply and return air grilles/registers are located in the suspended ceiling. In the open plenum ceiling examples, the HVAC air distribution is ducted supply and return. The typical HVAC system is a rooftop packaged air conditioner, with gas heating and electric dx cooling. Air distribution is constant volume.⁹

Electrical and Telecommunications

For the suspended ceiling example electrical wiring is MC cable and telecommunications wiring is plenum cable distributed above the ceiling, without cabletrays. In the open plenum example, power wiring is in conduit and telecommunications cable is plenum cable also without cabletrays, since there is very little telecom wiring in food stores. For both examples, telecommunications cable is assumed to be plenum rated to meet the requirements of NFPA 90A "Standard for the Installation of Air Conditioning and Ventilating Systems 2002"

Lighting

For the suspended ceiling example lighting is assumed to be recessed H.I.D. fixtures, 250W. For the open plenum example lighting is assumed to be H.I.D. fixtures with pendant mounts attached to the underside of the floor slab/roof above.

Typical floor plans and sections illustrate the office and food store building/space types (figure 3 and 4)

4. Costs Figure 1 - Office Suspended Ceiling Ceili

of Figure 2 - Food Store Suspended Ceilin

struction Suspended vs. Open

Plenum Design

Construction and operating costs are analyzed for the office and food store examples based on data from RS Means "Construction Cost Data 2007". The construction costs of the suspended ceiling vs. open plenum designs include the following:

- Suspended Ceiling System acoustical tile and suspension system
- Painting exposed slab/floor above and mechanical systems (ductwork)
- HVAC Systems fans, supply / return air ductwork, diffusers/grilles
- Electrical wiring distribution, conduit, cabletrays
- Lighting light fixtures, pendant, attachments

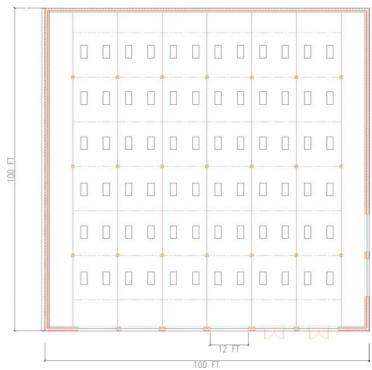

Figure 3 - Typical Food Store Plan

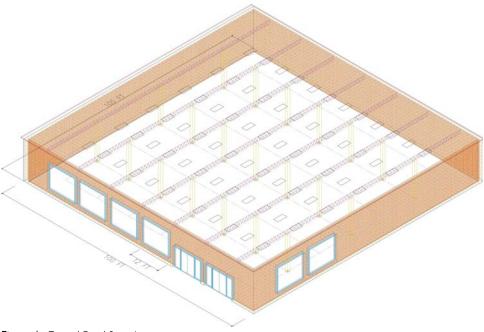

Figure 4 - Typical Food Store Isometric

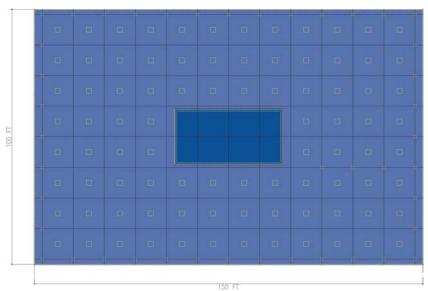

Figure 5 - Typical Office Plan

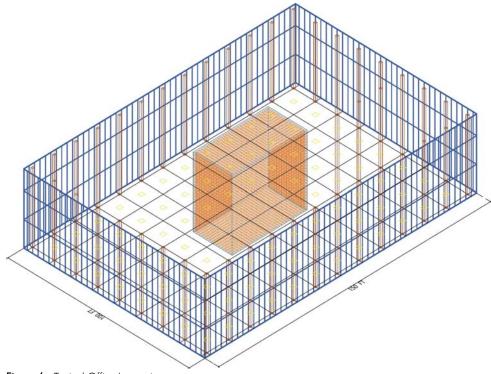

Figure 6 - Typical Office Isometric

The construction costs for the different regions are summarized in the following table, with a more detailed breakdown included in the appendix. Construction costs are highest in Chicago and Phoenix and lowest in Charlotte and Orlando.

Construction Cost	Chicago	Charlotte	Oklahoma	Orlando	Phoenix
Office Building					
Suspended Ceiling	\$164,636	\$95,247	\$99,528	\$96,453	\$108,152
Open Plenum	\$141,234	\$79,670	\$86,760	\$79,062	\$92,840
total cost increase	\$23,402	\$15,577	\$12,768	\$17,391	\$15,312
cost/sq.ft. Increase	\$1.56	\$1.04	\$0.85	\$1.16	\$1.02
% increase	16.6%	19.6%	14.7%	22.0%	16.5%
Food Store					
Suspended Ceiling	\$120,724	\$72,780	\$76,250	\$74,204	\$82,484
Open Plenum	\$114,808	\$67,493	\$73,259	\$67,118	\$78,055
total cost increase	\$5,916	\$5,287	\$2,991	\$7,086	\$4,429
cost/sq.ft. Increase	\$0.59	\$0.53	\$0.30	\$0.71	\$0.44
% increase	5.2%	7.8%	4.1%	10.6%	5.7%

The office building cost increases range from almost 15-20%, whereas the increase for the food store is an increase of about 4-10%. Detailed cost breakdowns are included in the Appendix. The construction cost premium for a suspended ceiling is greater for the office building than for the food store because it is a higher quality ceiling with a 2x2 grid and tile and a narrow profile suspension grid.

In general, the additional cost of the suspended ceiling, flex ducts, and cabletray is only partially offset by the additional costs of a return fan, return air ductwork, and conduit for the open plenum design. The cost of recess mounted light fixtures in the suspended ceiling is relatively close to the cost of pendant mounted light fixtures in the open plenum design.

To justify the additional cost of the suspended ceiling design, it must be offset by enhanced performance and reduced cost of operations such as lower energy cost, easier maintenance, and reduced cost of renovation and reconfiguration.

4. Operating Costs of Suspended Ceiling vs. Open Plenum Design

Operating costs, including maintenace and energy costs, are analyzed from data included in the 2007

BOMA Experience Exchange Report and from analysis of energy use for the different regions. Information related to energy costs and HVAC equipment sizing is determined from computer simulations of the two building types for each of the regions based on local weather and utility data. Utility data was reviewed for each region to insure that consumption (kWh) and demand (kW) charges reflected current rates and tarriffs for small to medium size commercial customers.

Although the BOMA data includes utility costs for the different regions, the energy/cost analysis is specific to the building types and layouts of the study to obtain a more accurate comparison of the trade-offs between the suspended ceiling and open plenum designs.

The energy use for the suspended ceiling examples is expected to be somewhat lower because of the use of a return air plenum with low static pressures and fan horsepower, instead of ducted air return with higher static pressures and fan horsepower. The suspended ceiling with a return air plenum is also more effective in removing heat of lights from the space, and therefore, reducing the air conditioning load on the space.

The suspended ceiling examples typically have higher (and more uniform) ceiling reflectances (i.e. 70% reflectance) than the open plenum examples with layers of equipment. The open plenum examples, with uneven ceiling and somewhat darker ceiling surfaces have somewhat lower light reflectance (i.e. 50% reflectance). These variables are included in the energy/cost model.

4.1 Maintenance Costs

The BOMA average operating costs for 2007 for the different regions is summarized in the following table.

	Chicago	Charlotte	Oklahoma City	Orlando	Phoenix
cleaning	\$1.60	\$1.01	\$1.18	\$1.08	\$0.85
repair / maintenance	\$1.80	\$1.01	\$1.19	\$0.73	\$1.42
utilities	\$1.51	\$1.51	\$2.26	\$2.57	\$1.88
roads / grounds	\$0.09	\$0.49	\$0.24	\$0.37	\$0.08
security	\$0.76	\$0.37	\$0.15	\$0.19	\$0.48
administration	\$1.53	\$1.03	\$1.05	\$1.12	\$1.54
total operating expense	\$7.22	\$4.93	\$6.04	\$6.05	\$6.13

Although it is difficult to define different requirements and costs of maintenance for a suspended ceiling vs. open plenum design, the analysis assumes there may be savings in not having to periodically clean ducts, pipes and raceways that may collect dust, by eliminating the need to paint or finish exposed equipment and systems, and by less overhead maintenance activities in general.

For the open plenum design to achieve a somewhat comparable architectural treatment with a

finished suspended ceiling, the open plenum design is assumed to be painted. The cost analysis assumes a painted open plenum ceiling and an additional 10% maintenance cost of cleaning and repainting (i.e. ranging from \$0.07-0.15/sq.ft.). This may be a particular concern in offices where there is more attention paid on maintaining acceptable levels of indoor air quality (i.e. prevent dust buildup on surfaces of equipment, ductwork, etc.) and a clean appearance in general. This is also a concern for any projects that may be considering LEED certification where issues of environmental stewardship are important, or in particular for concerns of health and cleanliness in food stores.

4.2 Energy Costs

The energy / cost analysis of the prototype office and food store located in each region includes information about the different building characteristics, systems, and operating schedules, as well as different construction costs of the suspended ceiling vs. open plenum designs.

The energy / cost analysis compares the energy cost/sq.ft. of the suspended ceiling and open plenum designs, a life cycle cost analysis (internal rate of return, life cycle payback, and simple payback), and indicates the reduced environmental emissions from the reduced energy use $(CO_2, SO_2, and Nox data$ is included in the Appendix). The results of the energy / cost analysis is summarized in the following table.

Building	Chicago		Charlotte		Oklahom	Oklahoma City		Orlando		Phoenix	
	Ceiling	Plenum	Ceiling	Plenum	Ceiling	Plenum	Ceiling	Plenum	Ceililng	Plenum	
Office											
Energy (Btu/sf/yr)	52,563	55,175	47,482	50,664	48,697	51,724	48,225	51,668	48,352	51,606	
Energy Cost (\$/sf/yr)	\$1.42	\$1.53	\$2.15	\$2.32	\$0.49	\$0.53	\$1.47	\$1.56	\$0.90	\$0.97	
Energy Cost Savings (5)	7.2%		7.3%		7.6%		5.8%		7.2%		
Internal Rate of Return	283.2%		<0%		129.4%		184.9%		<0%		
Life Cycle Payback	0.4 yrs		0.3 yrs		0.9 yrs		0.6yrs		0.1 yrs		
Simple Payback	0.3 yrs		0.3 yrs		0.7 yrs		0.5 yrs		0.1 yrs		
Food Store											
Energy (Btu/sf/yr)	106,281	116,506	82,775	96,468	91,119	102,895	89,117	105,256	87,842	101,578	
Energy Cost (\$/sf/yr)	\$2.34	\$2.81	\$2.69	\$3.28	\$2.05	\$2.38	\$2.92	\$3.42	\$1.60	\$1.88	
Energy Cost Savings (5)	16.7%		18.0%		13.9%		14.6%		14.9%		
Internal Rate of Return	84.3%		140.6%		135.8%		73.0%		79.6%		
Life Cycle Payback	1.4 yrs		0.8 yrs		0.8 yrs		1.6 yrs		1.5 yrs		
Simple Payback	1.1 yrs		0.6 yrs		0.6 yrs		1.2 yrs		1.1 yrs		

The rate of return, life cycle payback and simple payback data assumes relatively conservative cost increases for energy of 5%, a cost of capital of 10%, and an interest rate of 8%.

5. Conclusion - Life Cycle Cost of Suspended Ceiling vs. Open Plenum Designs

For the prototype office, the initial construction cost of the suspended ceiling design can range from almost 15% to 22% more than for an open plenum design. For the prototype food store, the initial construction cost of the suspended ceiling design can range from about 4% to over 10% more than for an open plenum design. However, the energy and maintenance savings justify the use of a suspended ceiling plenum, with extremely short simple paybacks of one to eight months for the office design, and 7 to 13 months for the food store design.

In addition to operating cost savings, the reduced cost of 'churn' including simple moves to and from existing workplaces, relocation of furniture, and reconfiguration of offices and workstations can be significant. The average cost of simple moves is about \$191 per move, for relocation of furniture it is about \$712/move, and for reconfiguration that requires construction it is about \$2,100 per move.

Suspended ceiling assemblies provide a flexible and accessible ceiling finish to allow for ease of reconfiguring building systems to accommodate changing work and space requirements. In office spaces, it is easier and less expensive to move flexible, modular components that can be unplugged and plugged into a different location with minimum construction. One of the primary reasons for the use of suspended ceiling systems is that they provide an architectural finish that provides acoustical performance and a fire rated assembly to create a plenum for the systems above, with the ability to reconfigure those systems above the ceiling as office workstations below are moved and relocated. The use of flexible ductwork, modular power and telecommunications cabling with UL rated connectors, light fixtures with modular 'pigtail' connections, and return air troffer light fixtures allows for easier and less expensive changes and reconfiguration.

Open plenum ceilings require that HVAC, power and telecommunications systems have some architectural treatment or finish (e.g. metal or gypsum enclosure, painting, etc.), that they be fire rated or enclosed in a fire rated assembly. Fixed components such as rigid metal ductwork, rigid metal conduit, hard wired power and telecommunications connections, and fixed mounted light fixtures are more difficult and expensive to move and reconfigure.

The environmental benefits of the suspended ceiling designs include reduced environmental emissions from lower energy use (CO_2 , SOx, and Nox) which are shown in the Appendix. For office spaces in particular, the potential benefits of being able to reconfigure air distribution and lighting with the changing layout of workstations can provide better control of indoor air and lighting quality.

Energy efficiency and indoor environmental quality are important considerations for certification with

Design & Technology Energy & Environmental Planning Construction Consulting

Barry Donaldson & Associates

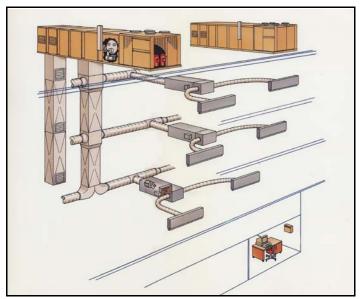

the USGBC "LEED Green Building Rating System". The magnitude of the energy savings is 5.8-7.6% for the office design, and 13.9-18% savings for the food store design. This is a significant improvement towards achieving additional LEED credits of 1 to 3 points (EA Credit 1 - Optimize Energy Performance" - 10.5% reduction for 1 point, 14% reduction for 2 points, 17.5% reduction for 3 points).

The ability to provide acoustical separation, privacy and sound attenuation, although not included in LEED, are also important indoor environmental issues for offices and retail food stores.

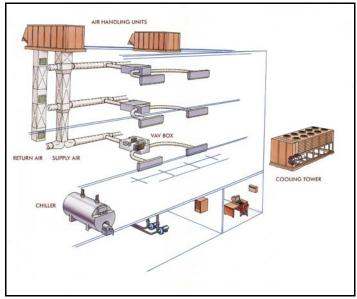

Today, the availability of many different suspended ceiling products, systems, and designs such as floating ceilings, curved ceilings, and transparent/translucent ceilings provides a great deal of flexibility for different applications.
